Google Gemini Getting Started — Concept Guide

Project overview

This project introduces a user to Google Gemini's standard chat interface and selected productivity features. It focuses on setting personalized instructions, testing prompt changes, understanding normal chat history, checking temporary-chat availability, and using Gmail integration to summarize emails and prepare a reply draft.

Purpose

Help users move from basic search queries to interactive AI assistance by establishing relevant context, consistent response formatting, careful session management, prompt refinement, and supported Google Workspace integration.

Learning objectives

• Configure profile context and response-style instructions where the account interface supports them.

• Test whether Gemini follows concise, practical, bullet-point formatting.

• Compare responses to original and revised prompts.

• Locate and reopen normal conversations in chat history.

• Investigate Temporary Chat availability and document account/interface limitations.

• If supported and authorized, summarize real Gmail messages and generate a draft for review.

• Record evidence-based test results without claiming unverified behavior.

Scope

In scope

• Gemini account and interface setup.

• Personalization/custom instructions.

• Test prompts TC-101 through TC-105.

• Normal chat history, temporary-chat availability, prompt editing, and deleting a test conversation.

• Gmail summary and draft generation, if available in the account.

• Testing documentation and submission artifacts.

Out of scope

• Creating custom Gems.

• Deep Research workflows.

• Canvas or other advanced document-building features.

• Third-party API connections such as Slack, Notion, or custom developer environments.

• Sending emails as part of the test; only draft generation is required.

Success criteria

• Instructions are entered and saved where supported.

• General-assistance answers follow the requested style.

• Prompt variations produce the requested constraints.

• Normal chat history behavior is observed.

• Temporary Chat availability is investigated and any limitation documented.

• Gmail output is checked against the actual inbox; drafts are reviewed and not sent.

• Repository files, PDF exports, and a demonstration recording are prepared.

Privacy and safety

• Do not put email contents, personal identifiers, or inbox screenshots in a public repository.

• Do not include passwords, verification codes, or access tokens in project files.

• Review Gmail drafts before sending. This assignment does not require sending a message.

• Distinguish actual observations from expected results and mark unverified tests accordingly.
