Google Gemini Getting Started — Implementation Plan

Goal

Configure Gemini's available personalization features, execute the prescribed tests, document observed results, and prepare the project submission.

Prerequisites

• Personal Google account signed in to Gemini.

• Desktop browser.

• Gmail account with Workspace/Gmail integration available, if the account supports it.

• A folder for screenshots and project files.

• GitHub account for the public repository.

Phase 1: Configure personalization

1. Open https://gemini.google.com/ and sign in.
2. Locate the personalization or instruction settings available in the account.
3. Enter the About You context: “I'm a small business owner. I use an Android phone and a Windows laptop.”
4. Enter the response style: “Give me concise answers using bullet points. Keep examples practical and business-relevant.”
5. Save the settings if the interface provides a save/submit action.
6. Run TC-101 and TC-102 to verify the response style.
7. Save screenshots that do not expose private information.

Phase 2: Execute prompt tests

1. Run TC-101: “What can you help me with today?”
2. Run TC-102: “How can I improve my customer response time?”
3. Run TC-103: “Give me 3 tips for better sleep.”
4. Run all three TC-104 prompt versions and retain the outputs.
5. Compare actual responses with expected constraints and update `testing_plan.md`.

Phase 3: Check Gmail integration

1. Check whether Gmail/Workspace integration is available.
2. Enable it only after reviewing the permissions and agreeing to them.
3. Ask Gemini to summarize the last three Gmail messages.
4. Compare subject, sender, and summary against the actual messages.
5. Ask Gemini to draft a polite, professional reply to the most recent email.
6. Review the draft for relevance. Do not send it for this assignment.
7. Do not include private email contents or inbox screenshots in the public repository.

Phase 4: Test chat lifecycle

1. Confirm a normal chat appears in recent history and can be reopened.

2. Look for Temporary Chat in the current interface.

3. If unavailable, record the menus checked and mark the test BLOCKED pending feature-availability verification.

4. Delete only a disposable test conversation if testing deletion; confirm it disappears from history.

5. Do not delete personal or important conversations.

Phase 5: Documentation and evidence

1. Complete actual results, status, and notes in `testing_plan.md`.

2. Capture screenshots of configuration and test results, with private data hidden.

3. Create PDF exports of the four required Markdown documents.

4. Record a walkthrough video showing setup, tests, history, temporary-chat availability check, and Gmail draft generation where available.

5. Review the repository for secrets and personal information before making it public.

Completion checklist

• [ ] Custom instructions configured where supported.

• [ ] TC-101 to TC-105 executed and documented.

• [ ] Normal chat history checked.

• [ ] Temporary Chat availability checked.

• [ ] Test conversation deletion checked.

• [ ] Four PDF exports generated.

• [ ] Public GitHub repository created.

• [ ] Demonstration video recorded.

• [ ] Privacy review completed.
